

1. Using the Taylor Table approach on the finite difference approximation of the 1st derivative

$$c \left(\frac{\partial u}{\partial x} \right)_{j-\alpha} + \left(\frac{\partial u}{\partial x} \right)_j = (au_j + bu_{j-1}) / \Delta x$$

- (a) Find the coefficients a, b , and c in terms of α which minimize the error er_t . (Points:6)

$$(HINT: u_{j-\alpha} = u_j - \alpha \Delta x \left(\frac{\partial u}{\partial x} \right)_j + \frac{1}{2!} (\alpha \Delta x)^2 \left(\frac{\partial^2 u}{\partial x^2} \right)_j - \frac{1}{3!} (\alpha \Delta x)^3 \left(\frac{\partial^3 u}{\partial x^3} \right)_j + \dots)$$

- (b) Find the resulting value of er_t , in term of α and find the value of α which *further* minimizes the error. (Points:4)

ANSWER Problem #1 From the Taylor table

	u_j	$\Delta x \cdot \left(\frac{\partial u}{\partial x} \right)_j$	$\Delta x^2 \cdot \left(\frac{\partial^2 u}{\partial x^2} \right)_j$	$\Delta x^3 \cdot \left(\frac{\partial^3 u}{\partial x^3} \right)_j$	$\Delta x^4 \cdot \left(\frac{\partial^4 u}{\partial x^4} \right)_j$
$c \cdot \Delta x \cdot \left(\frac{\partial u}{\partial x} \right)_{j-\alpha}$		c	$c \cdot (-\alpha) \cdot \frac{1}{1}$	$c \cdot (-\alpha)^2 \cdot \frac{1}{2}$	$c \cdot (-\alpha)^3 \cdot \frac{1}{6}$
$\Delta x \cdot \left(\frac{\partial u}{\partial x} \right)_j$		1			
$-b \cdot u_{j-1}$	$-b$	$-b \cdot (-1) \cdot \frac{1}{1}$	$-b \cdot (-1)^2 \cdot \frac{1}{2}$	$-b \cdot (-1)^3 \cdot \frac{1}{6}$	$-b \cdot (-1)^4 \cdot \frac{1}{24}$
$-a \cdot u_j$	$-a$				

the following equation has been constructed to maximize the order of accuracy

$$\begin{bmatrix} -1 & -1 & 0 \\ 0 & 1 & 1 \\ 0 & -\frac{1}{2} & -\alpha \end{bmatrix} \begin{bmatrix} a \\ b \\ c \end{bmatrix} = \begin{bmatrix} 0 \\ -1 \\ 0 \end{bmatrix}$$

This has the solution

$$\begin{bmatrix} a \\ b \\ c \end{bmatrix} = \begin{bmatrix} \frac{2\alpha}{2\alpha-1} \\ \frac{-2\alpha}{2\alpha-1} \\ \frac{1}{2\alpha-1} \end{bmatrix}$$

The Taylor series error of this difference scheme is

$$\begin{aligned} er_t &= \left(b \frac{1}{6} + c \alpha^2 \frac{1}{2} \right) \Delta x^2 \left(\frac{\partial^3 u}{\partial x^3} \right)_j \\ &= \frac{\alpha(3\alpha - 2)}{6(2\alpha - 1)} \Delta x^2 \left(\frac{\partial^3 u}{\partial x^3} \right)_j \end{aligned}$$

This shows that the scheme is second order for arbitrary α .

To further minimize the error, let $\alpha = \frac{2}{3}$, thereby eliminating the above term and forcing the error out to the next term

$$\begin{aligned} er_t &= \left(-b \frac{1}{24} + c (-\alpha)^3 \frac{1}{6} \right) \Delta x^3 \left(\frac{\partial^4 u}{\partial x^4} \right)_j \\ &= \frac{1}{54} \Delta x^3 \left(\frac{\partial^4 u}{\partial x^4} \right)_j \end{aligned}$$

Now a third order method.

2. Find the expression for the modified wave number of the scheme in terms of Δx and k . Cast the result in terms of \sin 's and \cos 's and where indicated use series expansion to identify the accuracy of the scheme.

(a) $(\delta_x u)_j = (u_{j-2} - 4u_{j-1} + 4u_{j+1} - u_{j+2}) / (4\Delta x)$ and identify the accuracy of the scheme. (Points:3)

(b) $(\delta_{xxxx} u)_j = (u_{j-2} - 4u_{j-1} + 6u_j - 4u_{j+1} + u_{j+2}) / \Delta x^4$ and identify the accuracy of the scheme. (Points:3)

(HINT: $\delta_{xxxx} e^{ikj\Delta x} = (k^*)^4 e^{ikj\Delta x}$, find $(k^*)^4 = k^4 + O(\Delta x^p)$, that is, don't try to take the 4th root..)

(c) $(\delta_{xx} u)_{j-1} + (\delta_{xx} u)_j + (\delta_{xx} u)_{j+1} = 3(u_{j-2} - 2u_j + u_{j+2}) / (4\Delta x^2)$ **Don't attempt to determine the accuracy, (too algebraically messy), it's a 4th order accurate method .** (Points:2)

(HINT: get the expression for $(k^*)^2$)

ANSWER Problem #2a

We apply $u_j = e^{ikj\Delta x}$ to both sides and get

$$(ik^* e^{ikj\Delta x}) = e^{ikj\Delta x} (e^{-2ik\Delta x} - 4e^{-ik\Delta x} + 4e^{+ik\Delta x} - e^{2ik\Delta x}) / (4\Delta x)$$

which give us

$$ik^* = i \frac{(4\sin(k\Delta x) - \sin(2k\Delta x))}{2\Delta x}$$

Expanding the \sin function gives

$$k^* = k + \frac{1}{3}k^3\Delta x^2 + \dots$$

showing a 2nd order approximation to the first derivative.

ANSWER Problem #2b

We apply $u_j = e^{ikj\Delta x}$ to both sides and get

$$((k^*)^4 e^{ikj\Delta x}) = e^{ikj\Delta x} (e^{-2ik\Delta x} - 4e^{-ik\Delta x} + 6 - 4e^{+ik\Delta x} + e^{2ik\Delta x}) / \Delta x^4$$

which give us

$$(k^*)^4 = \frac{(6 - 8\cos(k\Delta x) + 2\cos(2k\Delta x))}{\Delta x^4}$$

Expanding the \cos function gives

$$(k^*)^4 = k^4 - \frac{1}{6}k^6\Delta x^2 + \dots$$

showing a 2nd order approximation to the fourth derivative.

ANSWER Problem #2c

We apply $u_j = e^{ikj\Delta x}$ to both sides and get

$$-(k^*)^2 e^{ikj\Delta x} (e^{-ik\Delta x} + 1 + e^{+ik\Delta x}) = e^{ikj\Delta x} \frac{3}{4\Delta x^2} (e^{-2ik\Delta x} - 2 + e^{2ik\Delta x})$$

which give us

$$-(k^*)^2 = \frac{3}{4\Delta x^2} \frac{(-2 + 2\cos(2k\Delta x))}{1 + 2\cos(k\Delta x)}$$

Expanding the \cos functions gives

$$-(k^*)^2 = -k^2 + O(\Delta x^4)$$

a 4th order approximation to the second derivative.

3. Consider the predictor- corrector method

$$\begin{aligned}\tilde{u}_{n+1} &= u_{n-1} + 2h(\tilde{u}')_n \\ u_{n+1} &= u_n + h(\tilde{u}')_{n+1}\end{aligned}$$

applied to the representative equation

$$u' = \lambda u + ae^{\mu t}$$

- Identify the characteristic and particular operators as discussed in class, $[P(E)]$ and $\vec{Q}(E)$ and find the characteristic polynomial $P(E)$. (Points:3)
- Find the σ 's for this method (*HINT: it is a 2 root method*). (Points:2)
- Identify the principal and spurious roots and justify your choice. (Points:2)
- Find er_λ and identify the order of this method. (Points:2)
- Find the particular solution, u_∞ . (Optional:Points:1)
- Determine the stability of the method, i.e., conditions on λh . (Optional:Points:2)

(**Note:** The \sim in $(\tilde{u}')_n$ for the predictor step)

ANSWER Problem #3a

For the predictor-corrector combination

$$\begin{aligned}\tilde{u}_{n+1} &= u_{n-1} + 2h(\tilde{u}')_n \\ u_{n+1} &= u_n + h(\tilde{u}')_{n+1}\end{aligned}$$

Applying the time-marching scheme to the representative equation

$$\frac{du}{dt} = \lambda u + ae^{\mu t}$$

results in the following equation set

$$\begin{aligned}\tilde{u}_{n+1} &= u_n + 2h \left(\lambda \tilde{u}_n + ae^{\mu h n} \right) \\ u_{n+1} &= u_n + h \left(\lambda \tilde{u}_{n+1} + ae^{\mu h (n+1)} \right)\end{aligned}$$

Introducing the difference operator, E , the equation set may be expressed in matrix form as

$$\begin{bmatrix} E - 2\lambda h & -E^{-1} \\ -\lambda h E & E - 1 \end{bmatrix} \begin{bmatrix} \tilde{u}_n \\ u_n \end{bmatrix} = \begin{bmatrix} 2h \\ hE \end{bmatrix} ae^{\mu h n}$$

The results for $[P(E)]$ and $\vec{Q}(E)$ are obviously from the previous equation.

The characteristic polynomial equals the determinant of the matrix

$$P(E) = E^2 - (1 + 2\lambda h)E + \lambda h$$

The particular polynomial, $Q(E)$, for the final family u_n (as opposed to the intermediate family \tilde{u}_n) is given by

$$Q(E) = \det \begin{bmatrix} E - 2\lambda h & 2h \\ -\lambda h E & hE \end{bmatrix} = hE^2$$

ANSWER Problem #3b

The characteristic polynomial is

$$P(\sigma) = \sigma^2 - (1 + 2\lambda h)\sigma + \lambda h$$

giving

$$\sigma_{1,2} = \frac{1}{2} + \lambda h \pm \frac{1}{2}\sqrt{1 + 4\lambda^2 h^2}$$

ANSWER Problem #3c

$$\sigma_1 = \frac{1}{2} + \lambda h + \frac{1}{2}\sqrt{1 + 4\lambda^2 h^2}$$

and

$$\sigma_2 = \frac{1}{2} + \lambda h - \frac{1}{2}\sqrt{1 + 4\lambda^2 h^2}$$

An easy way to check for the principal and spurious roots is to let $h = 0$. For the principal root $\sigma = 1$ is consistent with $e^{\lambda h}$ for $h = 0$ and the spurious root will not equal 1. In this case $\sigma_1 = 1$ and $\sigma_2 = 0$ identifying the two types.

ANSWER Problem #3d

Expanding the square root for the principal root

$$\sigma_1 = 1 + \lambda h + \lambda^2 h^2 + \dots$$

and the transient error is

$$er_\lambda = -\frac{1}{2}(\lambda h)^2 + O(h^3)$$

a first order method.

ANSWER Problem #3e

The exact numerical solution to $u' = \lambda u + ae^{\mu t}$ is then

$$u_n = c_1 \sigma_1^n + c_2 \sigma_2^n + ae^{\mu h n} \frac{Q(e^{\mu h})}{P(e^{\mu h})}$$

which give us the Particular Solution

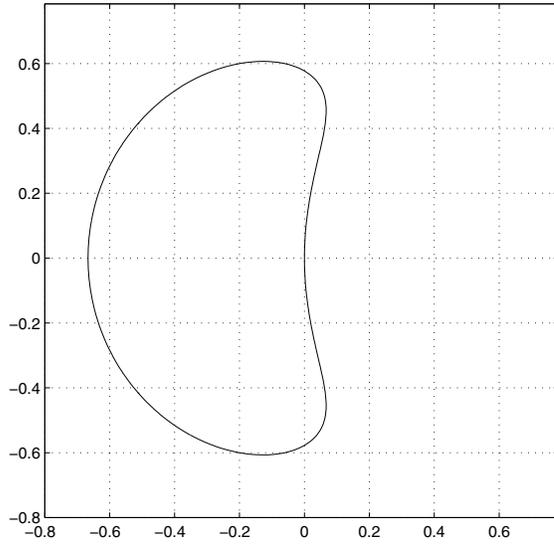

$$u_\infty = ae^{\mu h n} \cdot \frac{he^{2\mu h}}{e^{2\mu h} - (1 + \lambda h)e^{\mu h} + \lambda h}$$

ANSWER Problem #3f

Determine the stability of the method, i.e., conditions on λh . This is a little hard to do from the definition of the σ roots directly. The basic condition is $|\sigma_1| \leq 1$ and we also have to check the spurious root $|\sigma_2| \leq 1$. Probably the best way to proceed is to plot the σ roots in both the complex- σ and complex- λ planes as in Chapter 7 of the notes. From a matlab program we have

From the complex- λ plane figure one can pick off the stability bound as approximately $|\lambda h| < \frac{2}{3}$. Functional analysis confirms it.
